

Trusted Downloading Products List

The below Trusted Downloading Product List is a compilation of abstracts from test reports prepared by the Defense Security Service, the U.S. Air Force and/or the Department of the Navy security organizations. Inclusion on the Assessed Product List (APL) does not constitute endorsement or recommendation of any particular commercial product, nor does inclusion on this list constitute certification or accreditation for the product's use in any particular classified environment. The intent is to give security personnel information on the capability of the product, whereby, they can determine the possible application of the product to meet their security requirement. If the product lists a version number, only that version can be used for new Information System certifications/accreditations. Older versions included in systems that are already accredited are grandfathered for as long as the Information System retains accreditation.

The individual products were evaluated by staff of the Defense Security Service Office of the Designated Approving Authority. The evaluation provides assurance that the product meets the vendor's claim/documentation that certain embedded words and objects are identified. Because the evaluation was performed on a test configuration different from any contractor's operational configuration, each use of the product on different configurations must be tested and verified before authorization.
